LAB 9

For the problem you have received at the previous lab, you will have to

1) Specify completely (data, preconditions, results, postconditions) all the functions from your application.

2) For each function you will have to do white-box testing (testing by the text of subprogram).

3) Select a function of your choice and do black-box testing (testing by specification).

4) Use PyUnit for testing (rewrite all the existing test functions to use PyUnit)
